

smbXML Version 4.16 Release Notes

The following enhancements have been made in this version of smbXML.

New Attribute

The new document level **disableSystemNotesForCustomFields** attribute has been added. If this attribute is set to True, the creation of system notes when importing custom fields is disabled. Depending on the size of your import, this may significantly increase performance.

New Fields

Two new optional fields, **storePageTitle** and **storeMetaTagHTML**, are now available on the following item types:

- Inventory Item
- nonInventoryResaleItem
- serviceResaleItem
- nonInventorySaleItem
- serviceSaleItem

Import Queuing Improvements

Users can now upload multiple smbXML jobs via the UI and queue them for processing. The Upload Status page has been enhanced to allow users to view the position of their jobs in the queue. A link has also been added to the status page to permit users to cancel a queued job.

Improved Character Handling

The following improvements have been made regarding character handling in both smbXML imports:

- Imports now correctly trap and report illegal XML characters.
- Multi-byte UTF-8 characters are now supported in imports.
