

Inspect, Test, Rework, and Report

NetSuite Quality Management

Designing, manufacturing, distributing, and selling a product of high quality doesn't happen by accident, it requires a company-wide commitment to enforce policies and standards. NetSuite's Quality Management solution has been designed to help you deliver the highest quality in your products with minimal overhead regardless of the size and complexity of your business and product line.

Key Benefits

- Formalize quality policies, standards, and practices.
- Improve product quality.
- Initiate quality activities from business transactions.
- Work with large volumes of raw data sets.
- Collect in-process and incoming inspection results.
- Compare to pass/fail criteria.
- Integrate non-conformance reporting.
- Reduce cost of quality.

Inspections

The inspection record defines exactly what it is that you want your quality engineer to check. These inspection records can be re-used so, for example, you only have to create a “check for material certificates” inspection once—these are later grouped into specifications that are then applied to items, etc. There are currently two main types of inspections that are supported.

With **qualitative inspections**, the inspector can verify that the item is in good overall condition or verify that the appropriate certificates are in place.

Quantitative inspections, on the other hand, allow you to define multiple measurable elements along with criteria for acceptance, i.e. diameter, width, length, temperature, or even chemical composition.

Skip Lot, Sample Size, and Failures

Within each inspection, you can also specify how many items need to be inspected and define rules for inspecting specific sequences of lot or serial tracked items. Failures then define how many of the inspected units can fail inspection before the inspection itself is failed—kicking off the non-conformance workflow.

As an administrator, you are able to distinguish sample data from summary or aggregate data and control whether sample data should be recorded in NetSuite or stored externally, allowing you to easily work with larger volumes of raw data sets.

Test Definition

Each inspection can be set up with multiple data elements that define the parameters of the inspection process.

Primary Information

INSPECTION NAME * DESCRIPTION * INSPECTION TYPE * MANDATORY

INSPECTION METHOD *

Inspection Frequency And Sampling Requirements

DETAIL FREQUENCY (SKIP LOT) SAMPLE RATE ALLOWABLE FAILURES

Data Fields Standard Fields Rules System Information

Data Field List

SELECT	SEQUENCE	DATA FIELD	DATA TYPE ▲
Edit	1	Circuit Continuity	Boolean
Edit	2	Initial Resistance	Decimal
Edit	3	Material Receipt	Date

Data Fields define the information that must be entered during the inspection, i.e. length, width, and height.

Standard Field List		
New Standard Field		
SELECT	STANDARD FIELD	DATA TYPE ▲
Edit	Circuit Checks OK	Boolean
Edit	Resistance UCL	Decimal
Edit	Resistance LCL	Decimal

Standards fields are then established to define how the data field should be compared to a standard.

Rule List					
New Rule					
SELECT	SEQUENCE	RULE	DATA FIELD	COMPARISON	STANDARD FIELD ▲
Edit	1	Circuit Continuity Rule	Circuit Continuity	Equals	Circuit Checks OK
Edit	2	Initial Resistance Rule UCL	Initial Resistance	Less Than Or Equal To	Resistance UCL
Edit	3	Initial Resistance Rule LCL	Initial Resistance	Greater Than Or Equal To	Resistance LCL

Rules then establish how the data field entries should be compared to the standard and determine pass/fail.

Specifications

The specification record groups related inspections to establish quality activities. So, for example, when receiving some raw materials, you might confirm dimensions as well as verify that the appropriate certification is present. Additionally, the specification record allows the user to:

- Associate specifications to item/vendor/location combinations.
- Define inspection frequency via settings for skip-lot, sampling, and more.

- Define conformance rules that establish when an item fails an inspection.
- Display error messages that describe where and why updates failed.

Automatic Triggering of Inspections

Based on item/vendor/location associations, NetSuite item receipt transactions are monitored and can initiate inspection activities with different rules for each.

Inspector Assignment

Once an item has been identified as requiring inspection, an entry is made into the inspection queue where an individual quality engineer can be assigned to perform the task. Workflows can be utilized to automatically assign inspectors based on location, vendor, inspection type, etc.

Perform Inspections via Tablet

Inspections can be conducted on a mobile device using the NetSuite SCM Mobile app. The quality tablet interface enables quality engineers to perform inspections, review standards, record data, and submit data for analysis directly from the inspection area providing real-time feedback and instant access to test results.

Record

Once the user selects an inspection, they are walked through capturing the results and get real-time feedback where there are issues.

Workflow Driven Non-Conformance

Quality failures, or non-conformances, can drive additional activities within NetSuite through customizable workflows—the application provides initial workflows for:

- Quarantine and Release
- Initiation of Vendor Return Authorizations

Roles

The system comes with three distinct roles that are assigned to existing users:

1. **Quality Administrator:** Responsible for setup and maintenance of quality specifications, context checks, and workflow.
2. **Quality Manager:** Responsible for monitoring and managing quality execution and reporting.
3. **Quality Engineer:** Responsible for quality data collection.
